PROJECT NAME	iRevolution: A Data-Driven Exploration of Apple's iPhone Impact in India Using Tableau
MAXIMUM MARKS	2 MARKS

CHAPTER 2

Ideation Phase

2.1 - Problem Statement

Although Apple's iPhone is globally recognized as a premium smartphone brand, its growth and performance in the Indian market present unique challenges due to factors such as price sensitivity, strong competition from Android brands, diverse customer segments, and regional economic variations.

Despite the increasing availability of data related to smartphone sales, market share, customer behavior, and revenue, much of this data remains underutilized or poorly analyzed.

Traditional methods of data analysis, such as static reports and spreadsheets, fail to provide interactive insights and real-time understanding of complex market trends.

As a result, stakeholders such as business analysts, marketers, and decision- makers face difficulties in accurately assessing Apple's market position and identifying key growth opportunities in India.

The core problem addressed in this project is the lack of a comprehensive, visual, and data-driven analytical system to effectively study and understand the impact of Apple's iPhone in the Indian smartphone market.

There is a need for an intelligent solution that can transform raw datasets into meaningful visual insights, enabling users to analyze sales trends, customer preferences, regional demand, pricing patterns, and overall market performance.

Therefore, this project aims to design and develop an interactive data visualization framework using Tableau, which will help in exploring Apple's iPhone performance in India.

By integrating multiple datasets and applying analytical techniques, the project seeks to bridge the gap between raw data and actionable business insights, ultimately supporting better strategic decision-making and market understanding.
