2.2 – Empathy Map Canvas

The Empathy Map Canvas is a strategic design thinking tool used to gain a deeper understanding of the end users by capturing their thoughts, emotions, behaviors, motivations, and challenges.

It helps in identifying user expectations and aligning the system design with real user needs.

In the context of the project "iRevolution: A Data-Driven Exploration of Apple's iPhone Impact in India Using Tableau", the empathy map plays a crucial role in understanding how different stakeholders interact with data and what they expect from a data visualization system.

The primary users of this system include data analysts, business analysts, marketing professionals, research scholars, and organizational decision-makers who rely on data to evaluate Apple's market presence in India.

1. Think & Feel

Users think about the effectiveness of Apple's iPhone in the Indian smartphone market. There are curious to understand questions such as : How is Apple performing in India? What factors influence iPhone sales? Which regions contribute most to revenue? How do pricing strategies affect customer adoption?

Emotionally, users feel a strong need for confidence and clarity in decision- making. They want reliable insights rather than assumptions. They also feel pressure from organizations to present accurate results within limited timeframes.

This creates a demand for a system that reduces uncertainty and supports analytical thinking through visual representations

See

Users see a massive amount of raw data collected from different sources such as Kaggle datasets, market research reports, online surveys, and sales statistics.

In traditional formats like spreadsheets or static reports, the data looks overwhelming and difficult to interpret.

With Tableau dashboards, users see:

- Interactive bar charts, line graphs, pie charts, and maps
- KPIs showing market share, growth rate, and revenue trends
- Regional comparisons of iPhone adoption in India
- Time-based trends showing yearly or quarterly growth

This visual environment enables users to observe patterns, correlations, and anomalies that are otherwise hidden in raw data.

2. Say & Do

Users express that they need a user-friendly, flexible, and interactive system. They say that dashboards should be easy to understand even for non-technical stakeholders.

Users actively engage with Tableau by applying filters, sorting data, selecting parameters, and drilling down into specific categories such as year, model type, price range, and region.

They also perform actions such as:

- Generating analytical reports
- Exporting dashboards for presentations
- Sharing insights with team members

This shows that users not only consume data but also communicate insights derived from the system.

3. Hear

Users hear expectations and requirements from multiple sources. Management expects data-driven justification for every business decision.

Marketing teams emphasize the importance of understanding customer behavior and brand perception. Industry experts discuss trends like premium smartphone demand, 5G adoption, and digital transformation in India.

4. Pain Points

Despite access to data, users face several challenges:

- Difficulty in handling large datasets
- Poor data quality or missing values
- Complex relationships between variablesThese pain points reduce productivity and increase the risk of incorrect interpretations, leading to weak business decisions.

5. Gains

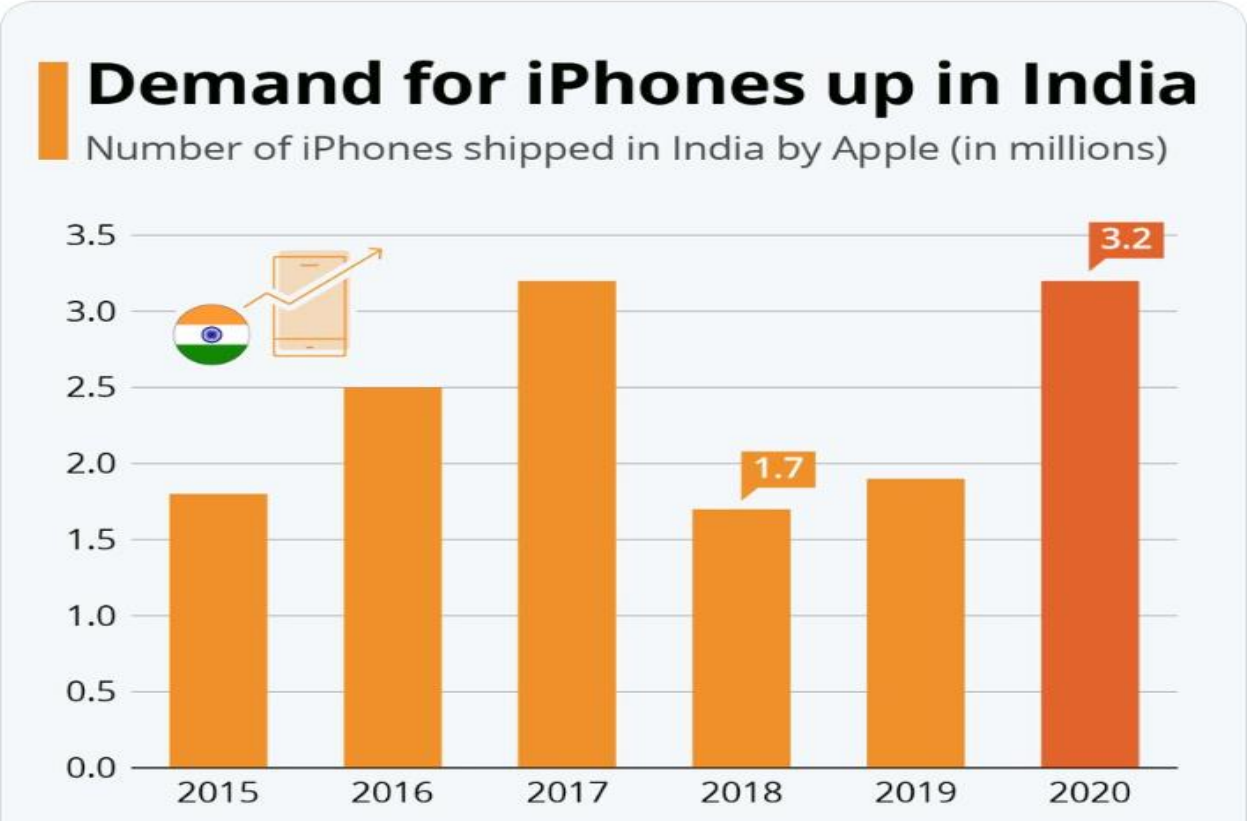
By using Tableau and a data-driven approach, users achieve multiple benefits:

- Faster analysis through automated dashboards
- Clear understanding of market performance
- Improved forecasting and trend identification

The system helps users convert raw data into actionable knowledge, making the analysis more impactful and valuable.

Strategic Relevance of the Empathy Map

The Empathy Map Canvas ensures that the project is not just technically and goal-oriented. It aligns system features with real-world user expectations and business needs.



- **Overview**

The Empathy Map Canvas is a visual strategic tool used to gain deeper insight into a target user's thoughts, emotions, behaviors, and motivations. It supports human-centered design by helping teams better understand user needs before developing products, services, or marketing strategies.

The tool was originally developed by XPLANE and is widely adopted in design thinking methodologies.
