3.3 – Data Flow Diagram (DFD)

A Data Flow Diagram (DFD) is a graphical representation that illustrates how data flows within a system.

It shows the movement of data from external sources to internal processes, data storage, and finally to outputs.

The main objective of a DFD is to provide a clear understanding of how data is collected, processed, stored, and transformed into useful information.

In the project "iRevolution: A Data-Driven Exploration of Apple's iPhone Impact in India Using Tableau", the Data Flow Diagram represents the complete flow of data starting from data sources related to Apple's iPhone in India, through preprocessing and analysis, and finally to visualization using Tableau.

Components of the Data Flow Diagram

1. **Processes** – Operations performed on the data
2. **Data Stores** – Locations where data is stored
3. **Data Flows** – Movement of data between components

Level 0 DFD (Context Diagram)
The Level 0 DFD provides a high-level overview of the entire system.

External Entities:

- Data Sources (Kaggle, market reports, public datasets)
- Users (Data Analysts, Business Managers, Students)

Main Process:

- iPhone Impact Analysis System

Data Flow:

- Data Sources → iPhone Impact Analysis System → Users

Level 1 DFD (Detailed View)

The Level 1 DFD breaks the system into multiple sub-processes.

Process 1: Data Collection

This process involves collecting datasets related to:

- iPhone sales
- Market share

Data Flow:

Data Sources
↓
Data Collection
↓
Raw Data Store

Process 2: Data Preprocessing

This process cleans and prepares the data. Activities include:

- Removing duplicates
- Handling missing values

Data Flow:

Raw Data Store
↓
Data Preprocessing
↓
Cleaned Data Store
