MAXIMUM MARKS	4 MARKS

3.4 – Technology Stack

The Technology Stack refers to the collection of tools, technologies, software, and platforms used to design, develop, and implement a system. It defines how different technological components work together to support data collection, processing, analysis, and visualization.

In the project "iRevolution: A Data-Driven Exploration of Apple's iPhone Impact in India Using Tableau", the technology stack is carefully selected to ensure efficient handling of large datasets, accurate analysis, and interactive visualization. The stack mainly focuses on Business Intelligence (BI) tools, data processing technologies, and system infrastructure.

The chosen technology stack supports the complete analytical pipeline, starting from raw data acquisition to final insight generation about Apple's iPhone performance in India.

1. Data Source Layer

This layer represents the origin of data used in the project.

Technologies Used:

- Kaggle datasets
- Public market research datasets
- CSV and Excel files

Purpose:

This layer provides structured datasets related to:

- iPhone sales
- Market share
- Pricing information

2. Data Processing Layer

This layer is responsible for cleaning, transforming, and preparing the data.

Technologies Used:

- Microsoft Excel
- Python (optional, for preprocessing)

Purpose:

- Removing missing values
- Data formatting and normalization

This ensures high-quality and reliable data for visualization.

3. Business Intelligence Layer

This is the **core layer** of the project.

Technology Used:

- Tableau (Tableau Desktop / Tableau Public)

Purpose:

- Connecting to datasets
- Creating calculated fields

4. Visualization Layer

This layer focuses on graphical representation.

Technologies Used:

- Tableau Dashboards
- Tableau Storyboards

Purpose:

- Line charts for growth trends
