9.2 Disadvantages:

1. Limited Data Availability

Accurate iPhone sales data in India may not always be publicly available. Some datasets may rely on estimates from market research firms.

2. Data Accuracy & Reliability

Secondary data sources (reports, websites) may vary slightly in numbers, which can affect analysis precision.

3. Scope Limitation

The project focuses only on Apple and may not deeply analyze:

- Consumer behavior psychology
- Supply chain complexities

4. Tableau Dependency

The analysis depends heavily on Tableau. If:

- The dataset is incomplete
- The tool is not properly used It may lead to misleading visualizations.

5. Time-Bound Analysis

Market conditions change rapidly. The insights reflect only the selected time period and may not predict future trends accurately.

6. Cost Factor (Real-World Context)

Apple's premium pricing may limit broader market penetration in India, which can influence long-term growth analysis.

7. Limited Access to Accurate Primary Data

Apple does not publicly disclose detailed India- specific sales data. Most information is taken from secondary sources such as market research reports, which may contain estimates rather than exact figures

8. Dependence on Secondary Data Sources

The project relies heavily on external reports (IDC, Counterpoint, Statista, etc.). If the data from these sources is outdated or inconsistent, it may affect the reliability of the analysis.

9. Rapidly Changing Market Conditions

The smartphone industry changes quickly due to:

- New product launches
- Price changes

Therefore, insights may become outdated in a short period.

10. Limited Consumer Behavior Analysis

While the project focuses on sales and market share, it may not deeply explore:

- Psychological factors influencing purchases
- Brand loyalty reasons
- Cultural preferences

11. Over-Reliance on Visualization

Tableau emphasizes visual representation.

If dashboards are not designed carefully, they may:

- Mislead interpretation
- Oversimplify complex data
- Hide underlying assumptions

12. Data Cleaning Challenges

Raw datasets may contain:

- Missing values
- Inconsistent formats

This requires time-consuming preprocessing and may affect accuracy.
